

TRIL – Technology Research for Independent Living

Seamus Small
TRIL Centre Manager
11th May 2011

Mission

TRIL's mission is to carry out scientific ageing research that informs person-centred technology development and models of care that **promotes** independent living, by **predicting** health status and **preventing** decline in older people.

Vision

Advances in technology combined with new models of health care will transform the way we live, adding life to years.

DUBLIN

GE Healthcare

discovery.....design.....implementation.....evaluation

TRIL Centre - Characteristics

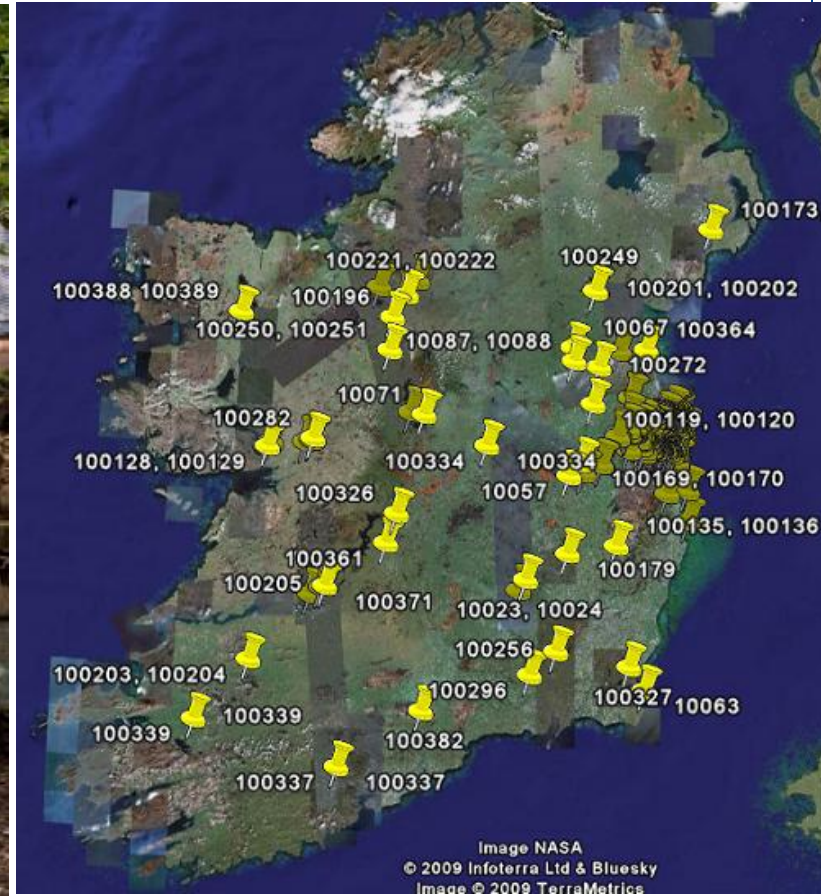

- Applied Approach – taking findings into the home/community
- Industry/Academic collaboration
 - Active Industry engagement – not industry sponsored
 - Good blend of industry, clinical & academic environments
- Clinically informed technology development
- Truly Multidisciplinary – technologists, scientists and clinicians working collectively
- Quantitative & Qualitative

TRIL Clinic, St. James's Hospital, Dublin

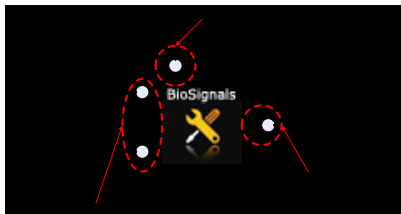

TRIL Participant Cohort (625)

Technology & Design

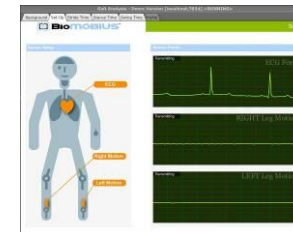

Technology Building Blocks

User-Centred Design Approach

Technology Prototypes

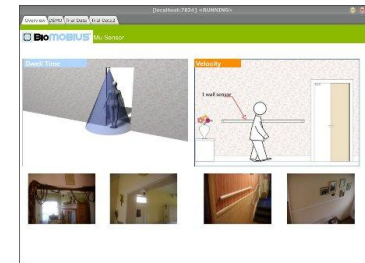

Kinematic, Physiological
and Ambient Monitoring

Cognitive Function and
Alertness stimulation

Home Evaluation

SOFTWARE ENGINEERING

BIOMEDICAL ENGINEERING

INTERACTION AND INDUSTRIAL DESIGN

ETHNOGRAPHY

INFRASTRUCTURE AND DATABASE
MANAGEMENT

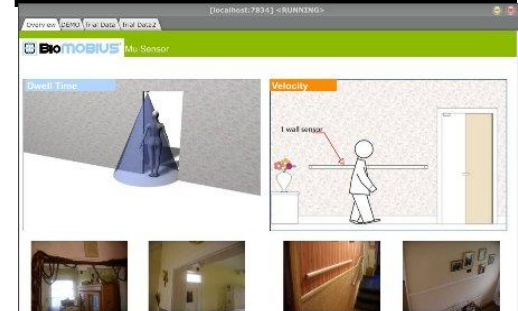

HUMAN COMPUTER INTERACTION

FIRMWARE / HARDWARE DESIGN
ENGINEERING

Home Technology Evaluations

Taking research from the Lab to the Home – *Home Deployment Programme*

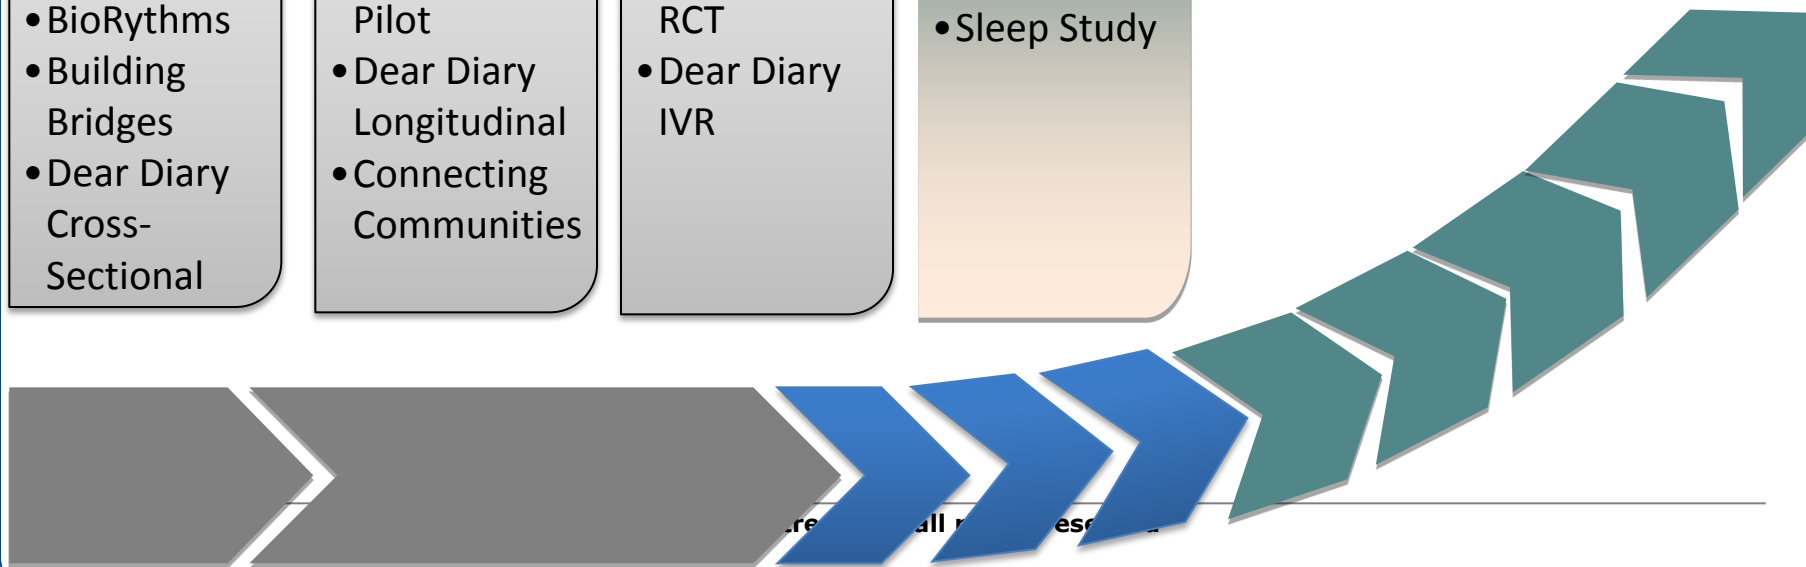

- Evaluation technologies in a real world environment, focus on:
 - Usability
 - Efficacy
 - Robustness
- Controlled -> Uncontrolled
 - Challenges: Environmental/Ambient, Communications, Co-inhabitants, Pets, etc.
- Active cohort from TRIL Clinic
- Goal to establish a large test-bed infrastructure
 - Hundreds -> Thousands

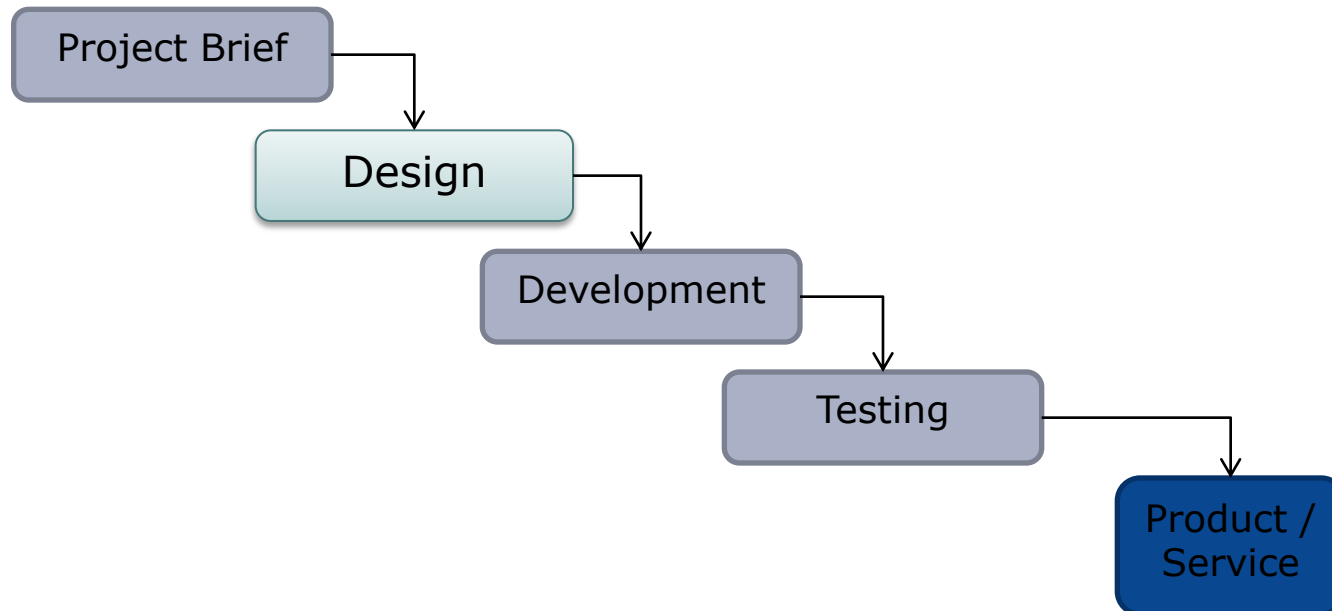

Home Deployment Journey

2008	2009	2010	2011
4 Home Trials	4 Home Trials	3 Home Trials	5 Home Trials
133 Homes	135 Homes	140 Homes	155 Homes
<ul style="list-style-type: none">• VoIP Trial• MuSensor• Engineering Alertness• BioRhythms• Building Bridges• Dear Diary Cross-Sectional	<ul style="list-style-type: none">• Balance & Strength• Engineering Alertness Pilot• Dear Diary Longitudinal• Connecting Communities	<ul style="list-style-type: none">• Wellness & Exercise• Engineering Alertness RCT• Dear Diary IVR	<ul style="list-style-type: none">• TRIL Testbed (3 trials)• Perceptual Function• Sleep Study

- 27 Design Workshops
- 16 Home Trials
- 563 Homes visited
- .5 TB Data Collected

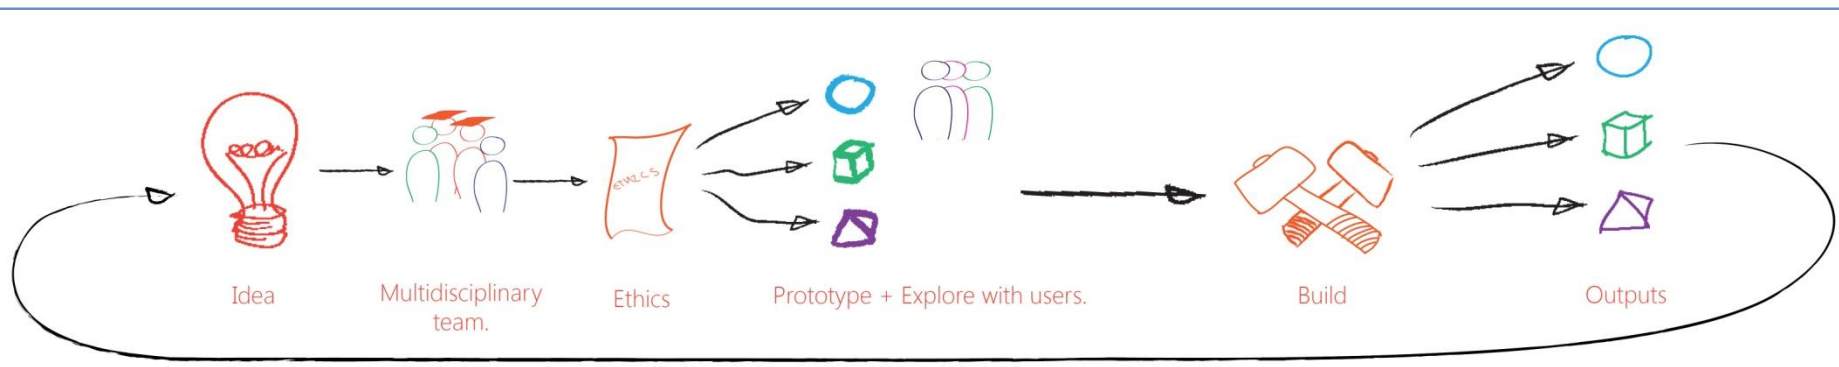

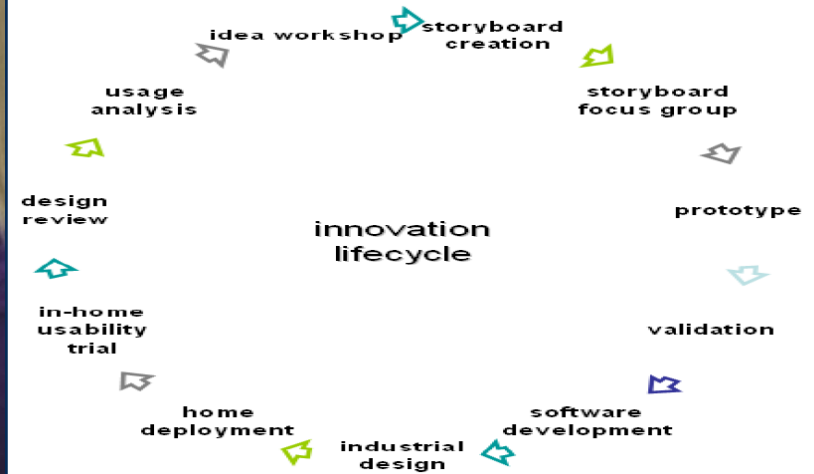

Design often fits within a part of a lifecycle..

Are users needs considered?

- **Traditional Project Brief:** A project brief may come from a marketing or a technical department. It often make assumptions about users.
- **TRIL Project Brief:** TRIL uses ethnographers and designers to explore the project brief, as often 'users' needs will not be considered in the project. By watching and talking to users we can understand how to better create product and services to help them.
- **Design (Traditional):** Design is part of waterfall process and has a distinct phase, all details are highly documented and passed over to the development team.
- **Design (TRIL):** TRIL creates design prototypes that can be quickly iterated early on the project. The design team works along with the development team to enable good user experience thought the agile development process by focusing on good user experience.

User-Centred Design

User-Centred Design

Finding the right design

Exploring the problems
with existing biofeedback
technology

Developing and
evaluating new
biofeedback technology

Form-factor
ideation

Getting the design right

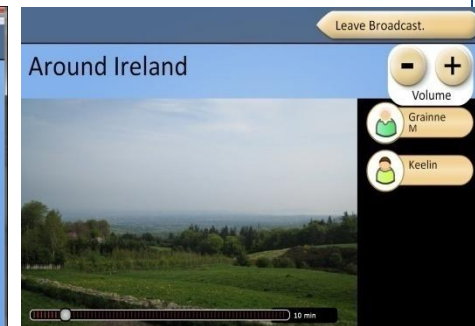

Exploring chosen
form-factor

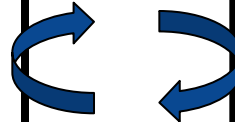

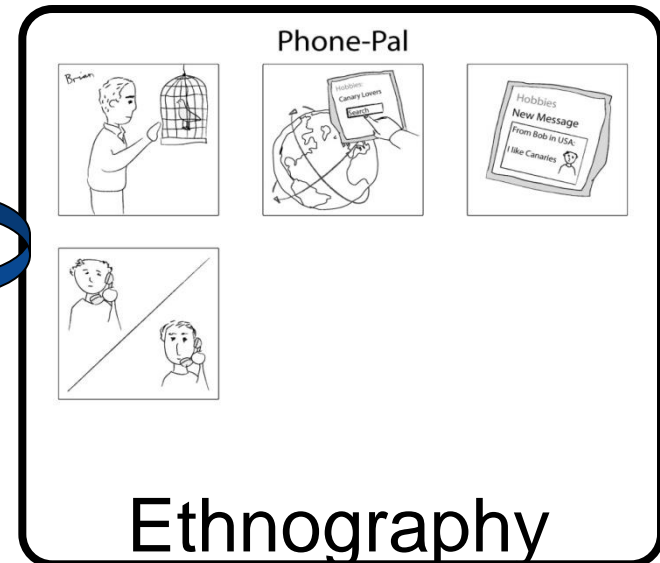

Integration of technology
in the final design

The Building Bridges Project

Goal: Co-design and develop intuitive communication technology for older people to support social connection and reduce risk of loneliness and social isolation

The Building Bridges Project

Phase 1

Understand
Problem

- Home Visits
- Expert interviews
- Technology review
- Skype phone pilot

Phase 2

Develop
Concept

- Workshops.
- Focus groups

Phase 3

Explore
requirements

- Concept Review
- Think aloud

Phase 4

Refine

- Home trials
- Iterative Development

Developing the concept

As many as 10 variations of screen designs are proposed in group design meetings.

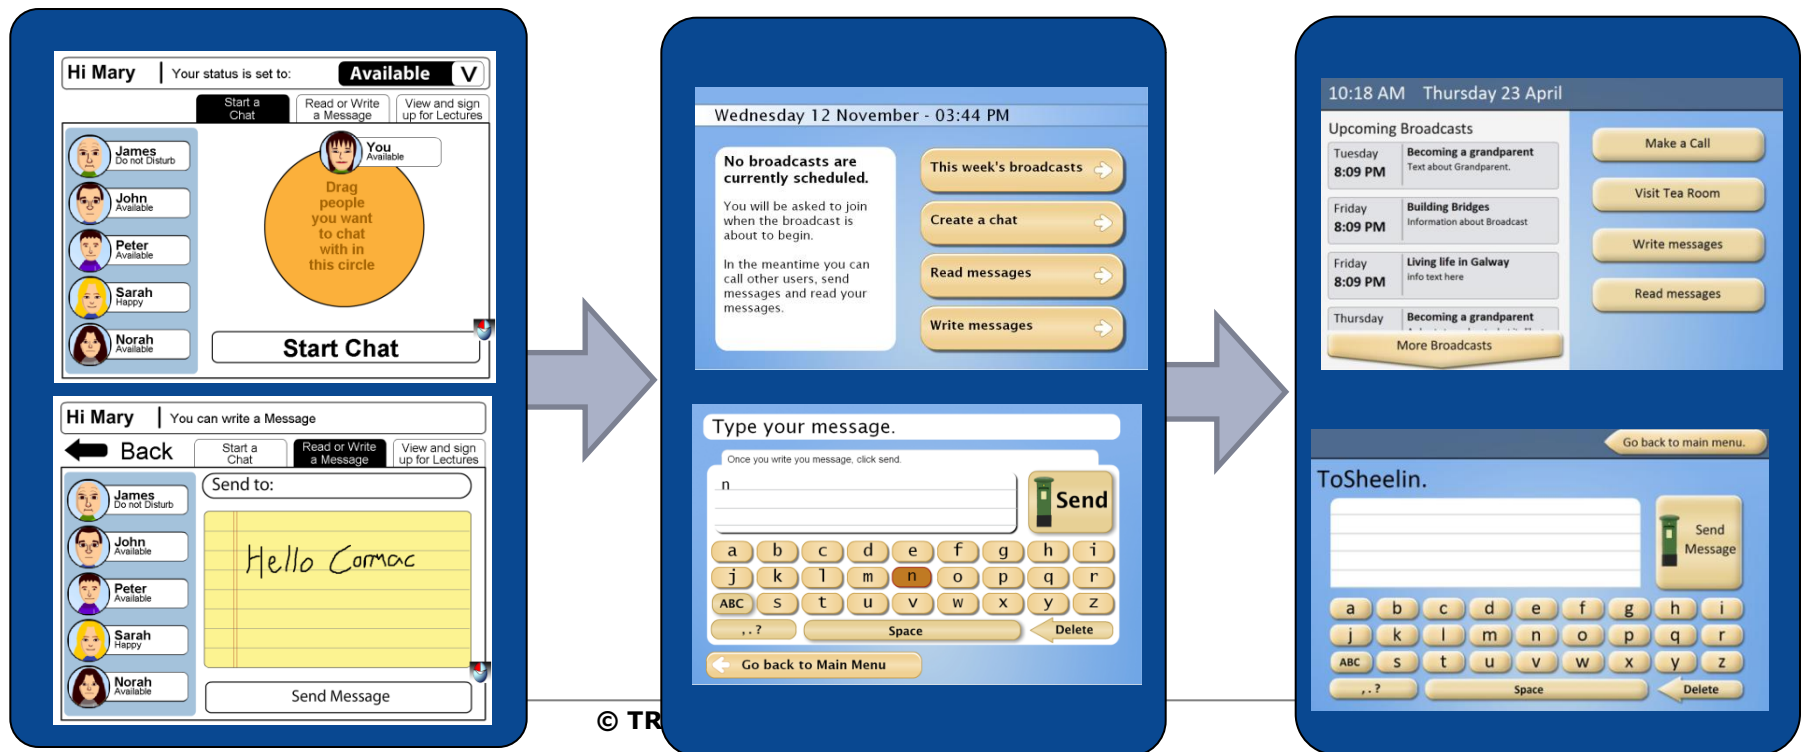

Allows all stakeholders to understand interaction, flow and features.

Designed using standard design patterns.

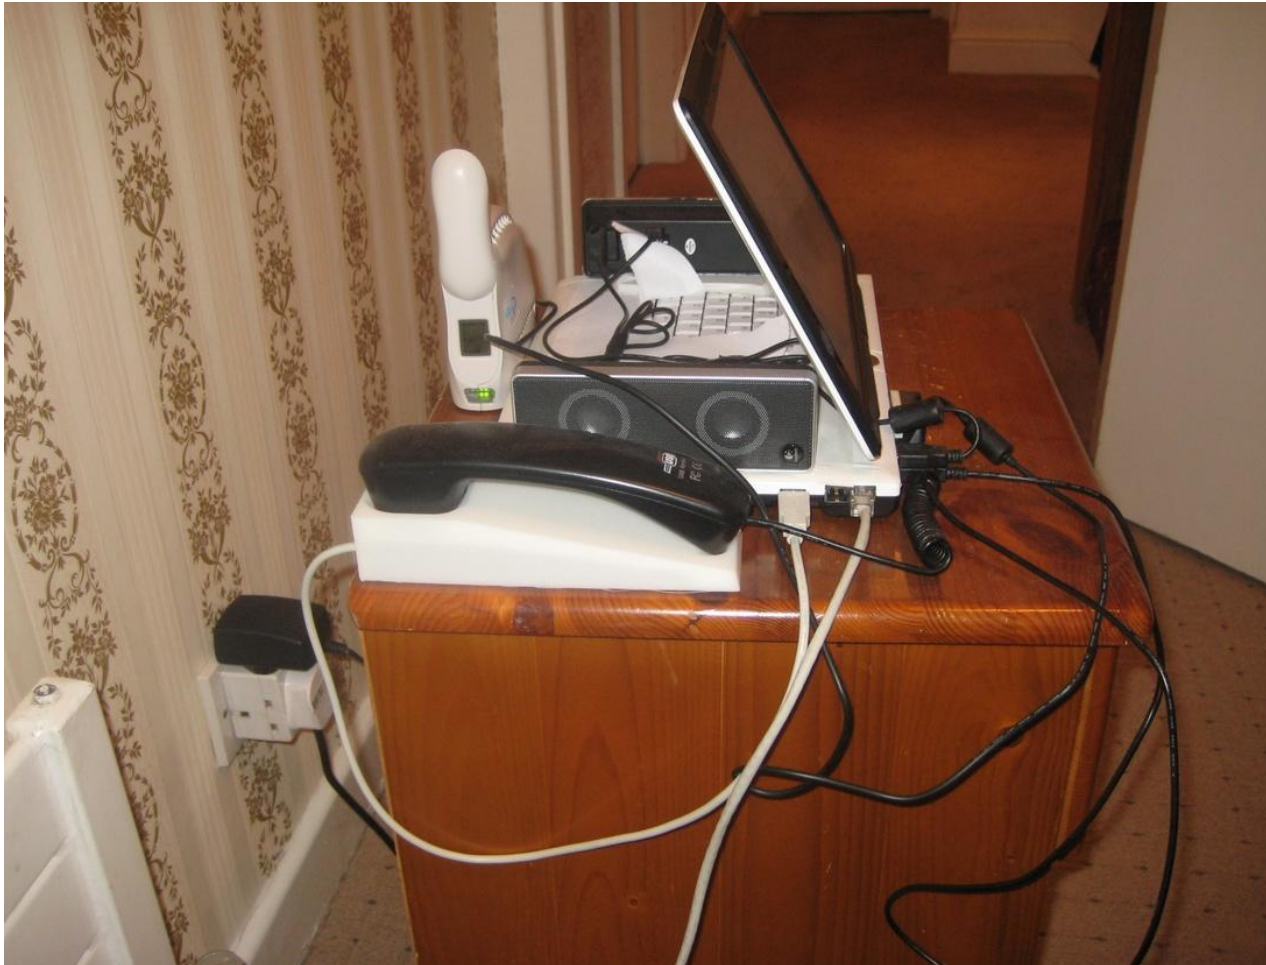

Interface Development

- Human Computer Interaction interview techniques were used to establish:
- Requirements:** e.g. visual supports, button size, language
 - Interaction:** e.g. text entry, input methods
 - Layout:** e.g. affordance, orientation, position of buttons

Early prototype in the home

1st iteration of hardware design.

Better Hardware, Better usage

Cleaner Product Identity.

More suited for deployment.

Friendlier Aesthetic.

User-Centred Design approach very much applicable in designing technologies for Intellectual Disability:

- Ethnography
- Storyboarding
- Prototyping
- Workshop/User Forums
- In-home technology deployments

User involvement is critical in designing technologies – you cannot simulate the experience or assume needs for users

Create an early solution and work with users to refine and develop it further – don't try to develop final solution in one cycle
